A CRM APPLICATION FOR THECHAISHOP&CO;

SALESFORCE CRM — FINAL PROJECT REPORT

Project Documentation, Implementation, Testing & Evidence

Developed / Submitted By	**Jamuna V**
Platform	Salesforce Lightning / Salesforce Platform
Project	TheChaiShop&Co; CRM Application

Note: This report uses the Salesforce screenshots from the project evidence supplied in this conversation. Reference material was used only to organize the topics; reference screenshots are not reproduced here.

1. Project Overview & Objectives

TheChaiShop&Co; CRM project is implemented on Salesforce to centralize customer, employer and enterprise information. The configured application combines structured records, validation, order-related fields, automation, reports and dashboards in one Salesforce environment.

• Manage Customer Account, Employer Account and Enterprise Account records in a structured way.

• Improve data accuracy using validation rules for important fields.

• Separate Online Orders and Walk-In Orders using record types and page layouts.

• Automate birthday-related email communication using an email alert and scheduled flow.

• Generate Customer Account and Enterprise Account sales reports and combine them in a dashboard.

The project evidence shows that the Salesforce environment contains the configured validation rules, email alert, record types and other components used in the implementation.

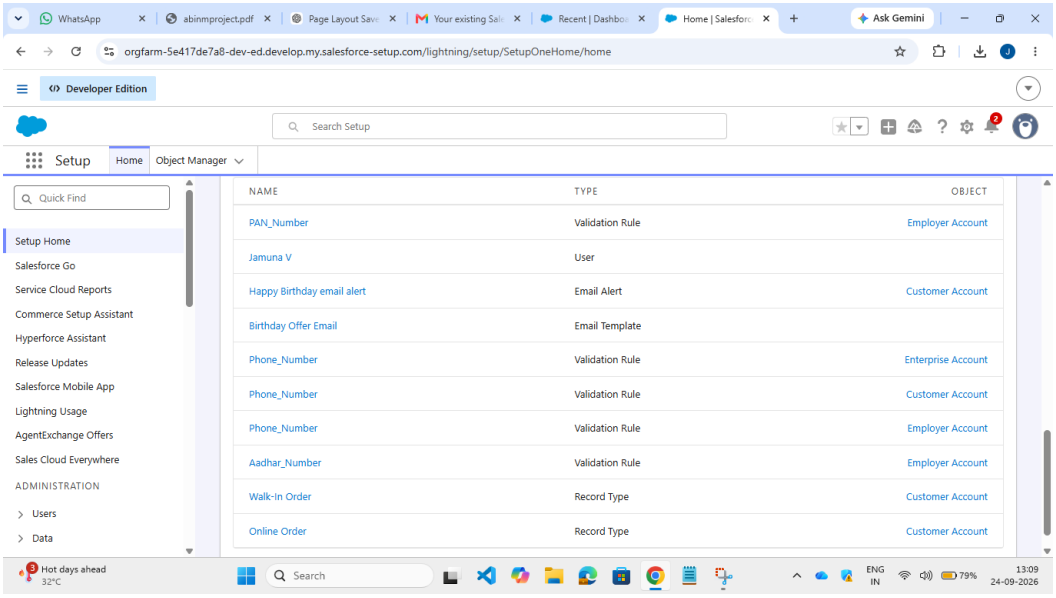

Figure 1. Salesforce Setup evidence showing configured project components.

2. Salesforce Setup and Configured Components

The Setup Home screen provides a quick view of the configuration created during the project. The evidence includes validation rules for employer/customer/enterprise records, the birthday email alert, the birthday email template and the Online Order and Walk-In Order record types. This confirms that the main configuration objects were created and available in the Salesforce environment.

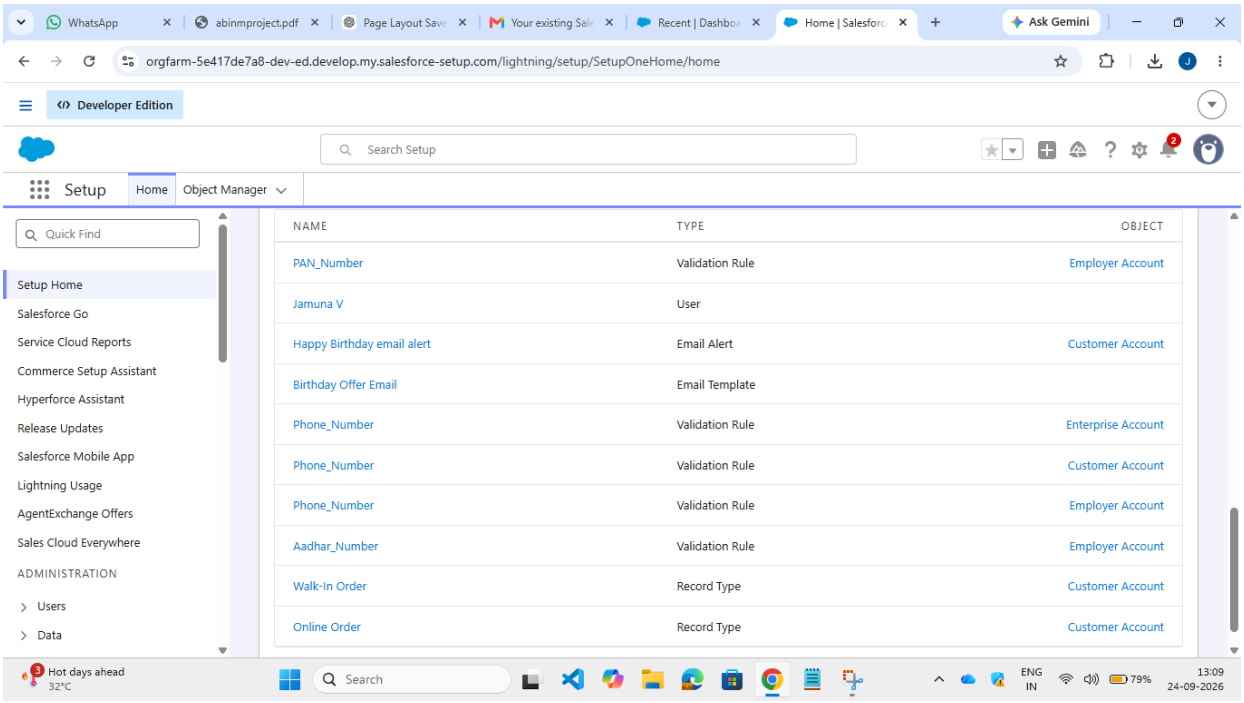

Figure 2. Salesforce Setup configuration evidence.

3. Customer, Employer and Enterprise Account Evidence

The application uses separate account areas for Customer Accounts, Employer Accounts and Enterprise Accounts. The Customer Account list shows test customer records, while the Employer Account list shows employer records created during testing. These records provide the working data used later for validation, reports and dashboard analytics.

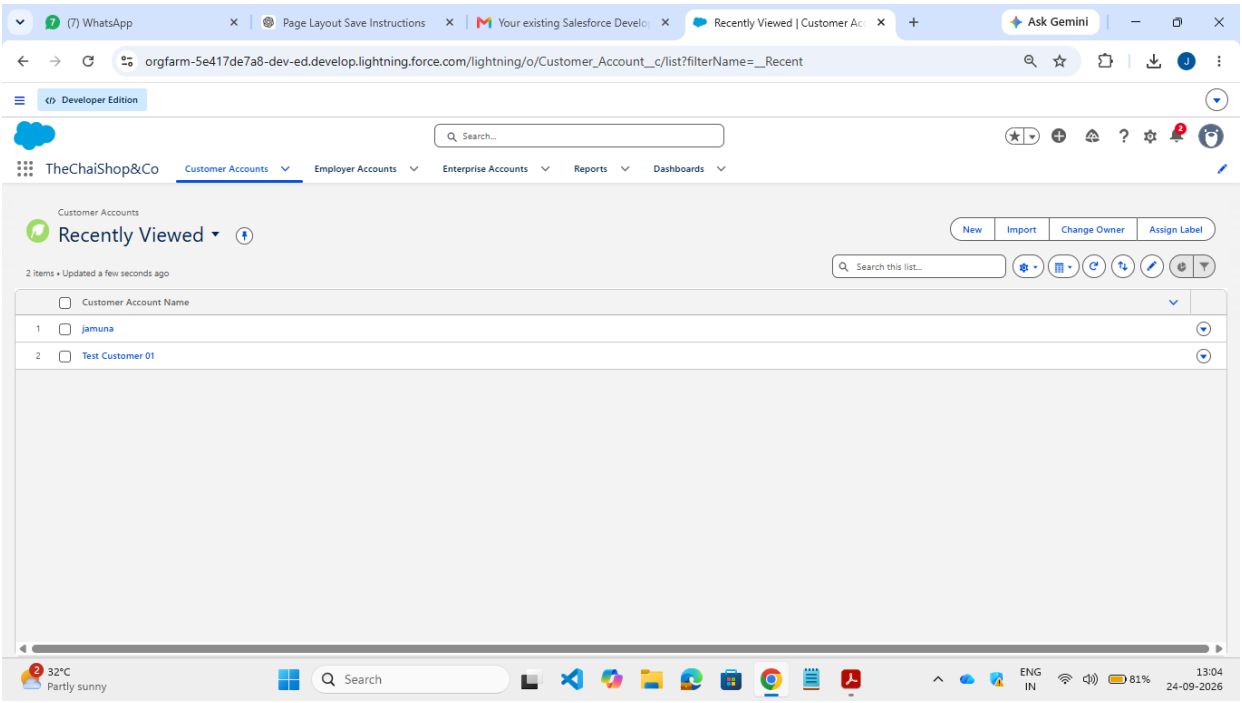

Figure 3. Customer Account test records.

The Employer Account area was also populated with test records. Keeping employer records separately makes it easier to maintain employer-specific information and associate it with customer or enterprise records where required.

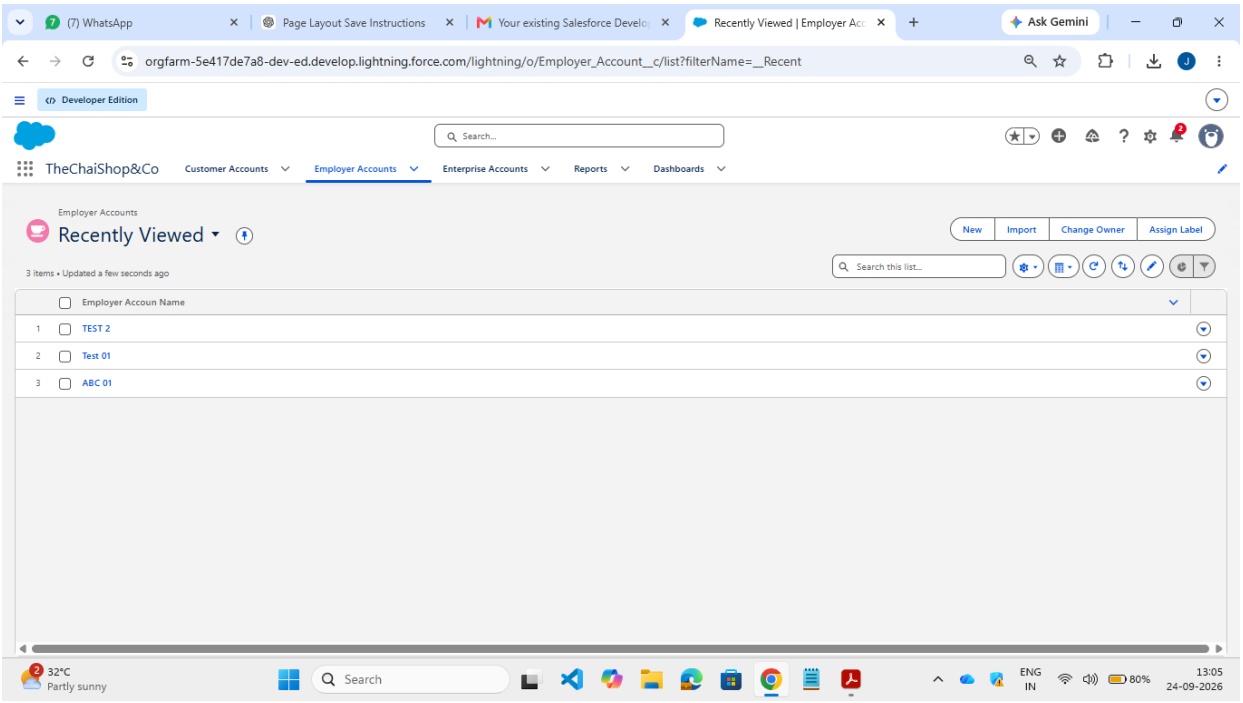

Figure 4. Employer Account test records.

4. Fields & Relationships

Customer Account contains the personal, contact and order-related fields used by the application. The fields shown include Date of Birth, Email ID, First Name, Gender and an Associated Employer lookup. The Associated Employer relationship allows customer information to be connected with employer information.

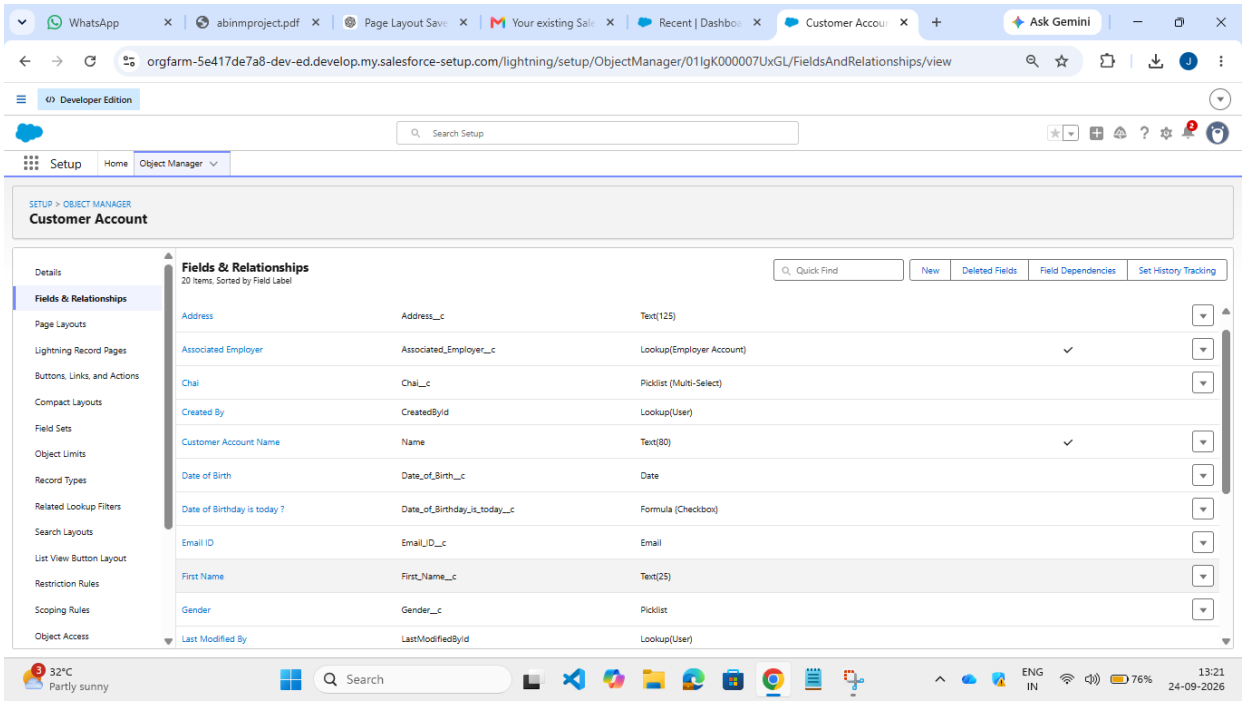

Figure 5. Customer Account Fields & Relationships.

Employer Account contains dedicated fields for identity and employment information. The Aadhaar Number field shown in the evidence is a text field belonging to the Employer Account object. Similar project fields include phone number, email, date of birth, PAN details, designation and salary.

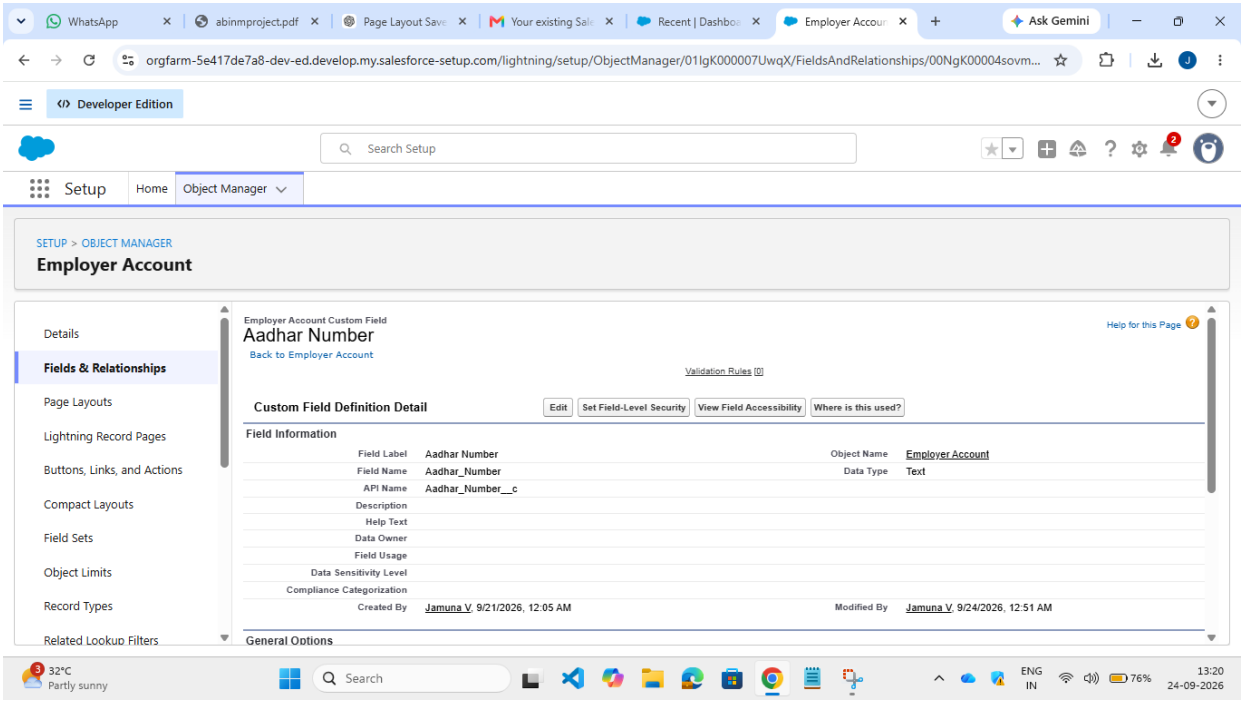

Figure 6. Employer Account custom field evidence — Aadhaar Number.

6. Chai Picklist Values Configuration

The Customer Account object contains the Chai field as a multi-select picklist. The screenshot below shows the values configured for this field in Salesforce. These values provide controlled choices for recording the tea type associated with a customer order.

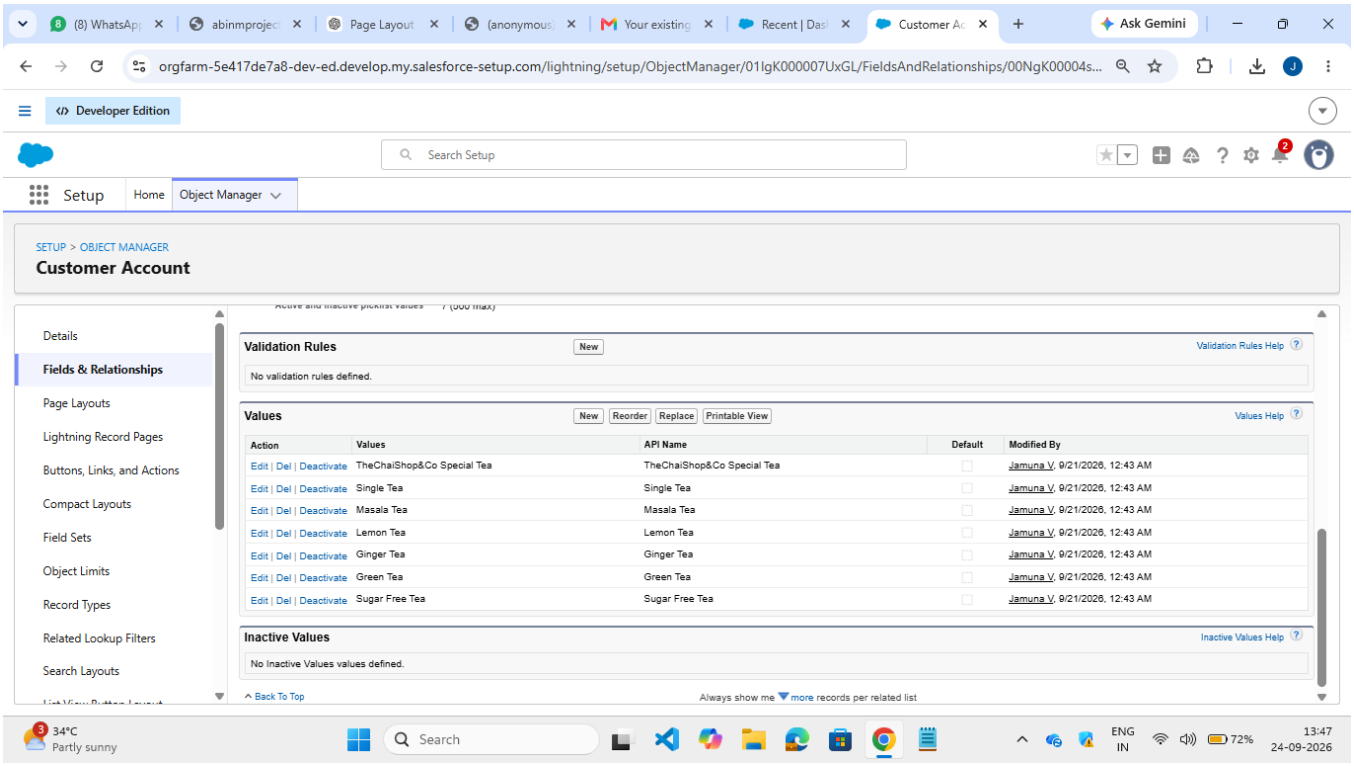

Figure: Chai multi-select picklist values configured in Customer Account.

Configured values shown include:

- TheChaiShop&Co Special Tea
- Single Tea, Masala Tea, Lemon Tea and Ginger Tea
- Green Tea and Sugar Free Tea

5. Page Layout Configuration

Page layouts control how fields are arranged when users create or view records. The Customer Account object contains separate layouts for the main customer form and the Online Orders / Walk-In orders variants. This configuration makes the record-entry screens easier to use and aligns them with the record types.

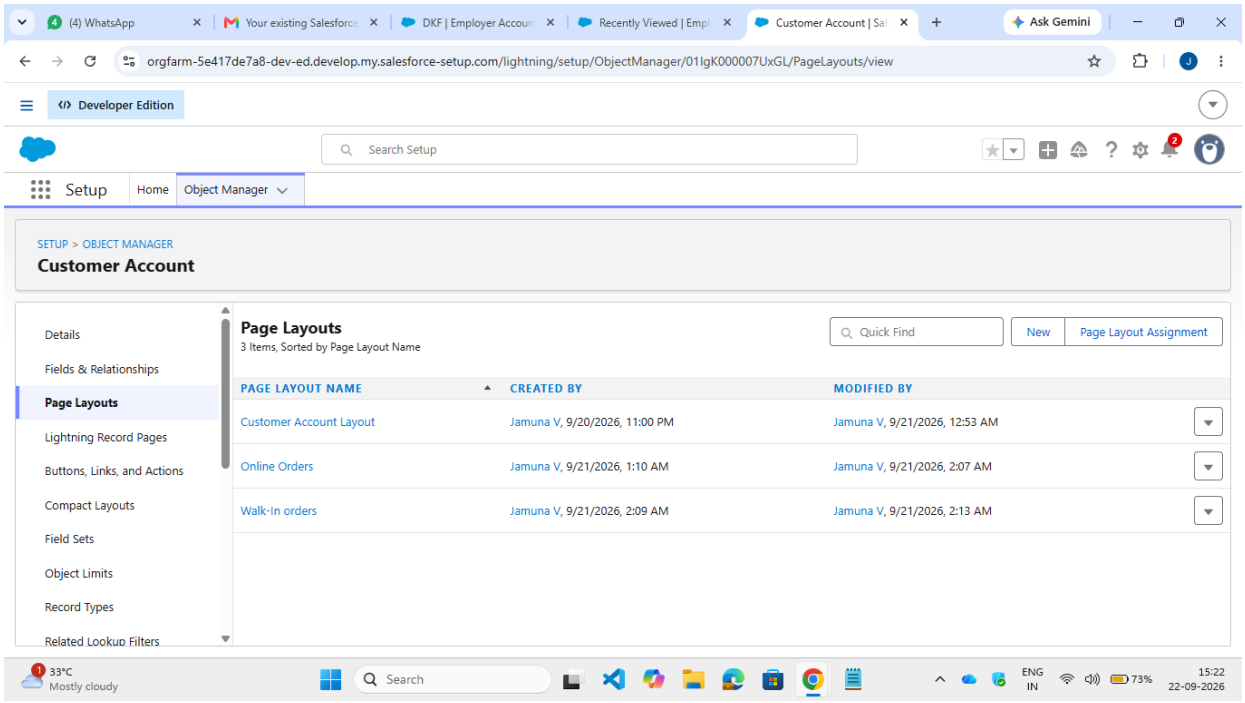

Figure 7. Customer Account Page Layouts.

The page-layout editor shows the actual field placement used in the Customer Account form. Customer details, order fields, payment information and related fields are arranged in the layout so that the completed record can be entered and reviewed in a consistent format.

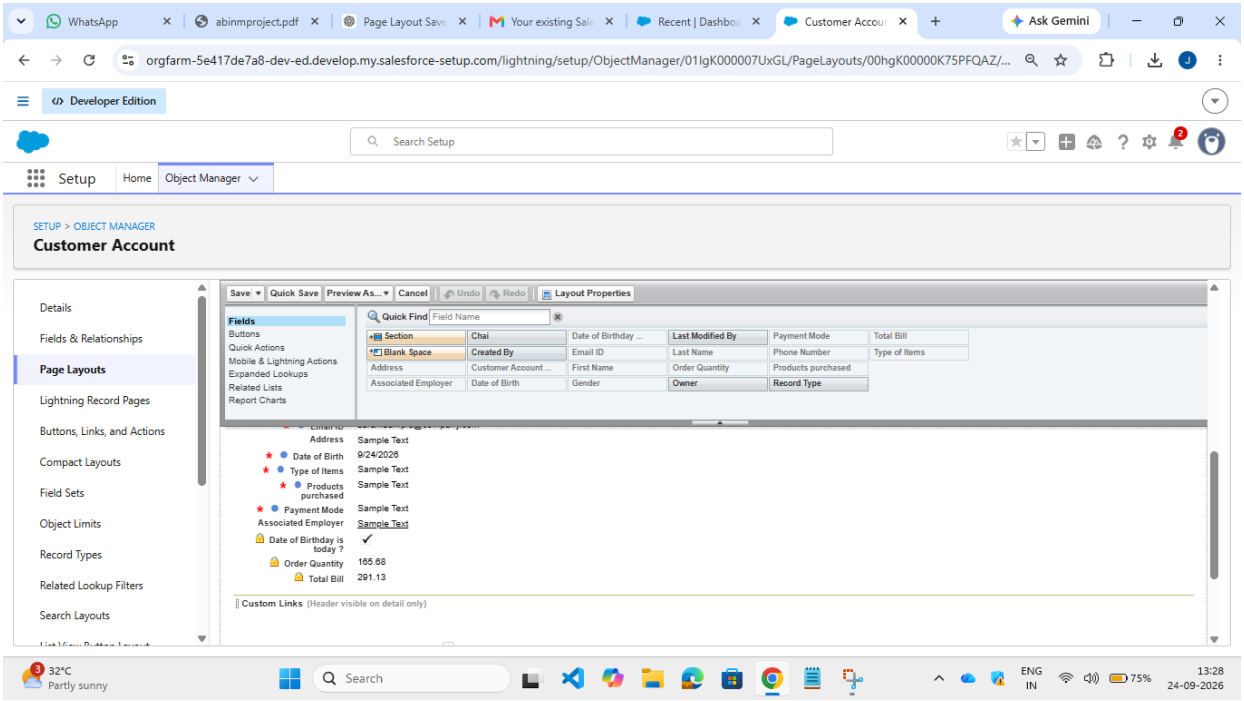

Figure 8. Customer Account Page Layout editor.

6. Record Types — Online and Walk-In Orders

Two active record types were configured for Customer Account: Online Order and Walk-In Order. Record types allow the same object to support different business processes. Each record type can use its own page layout, so online and walk-in order entry can be presented differently while remaining within the same Customer Account object.

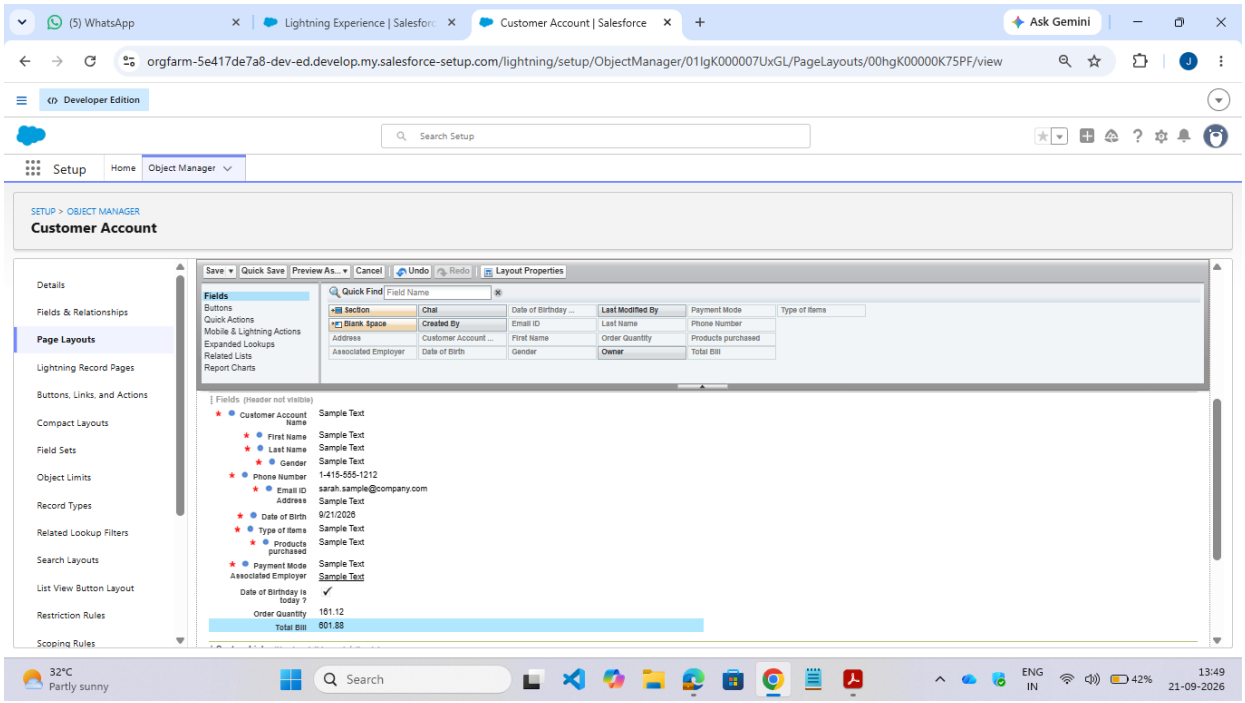

Figure 9. Active Online Order and Walk-In Order record types.

7. Validation Rules and Testing

Validation rules are used to stop invalid values from being saved. The Employer Account validation-rule list shows active rules for Aadhaar Number, PAN Number and Phone Number. The messages are designed to guide the user toward valid data entry.

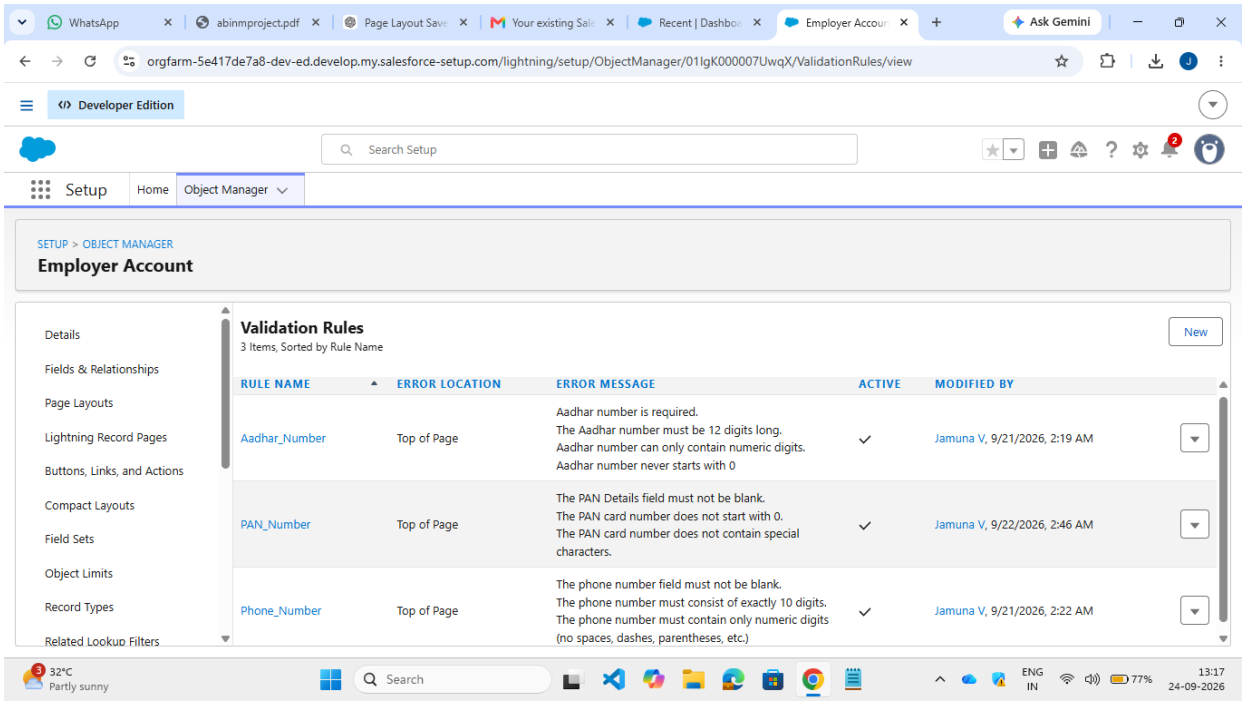

Figure 10. Employer Account validation rules.

The Aadhaar Number field is configured as a custom text field. The project validation logic is intended to check required entry, length, numeric-only content and the first digit condition. During testing, an invalid value was entered and Salesforce displayed a validation message instead of allowing the record to be saved.

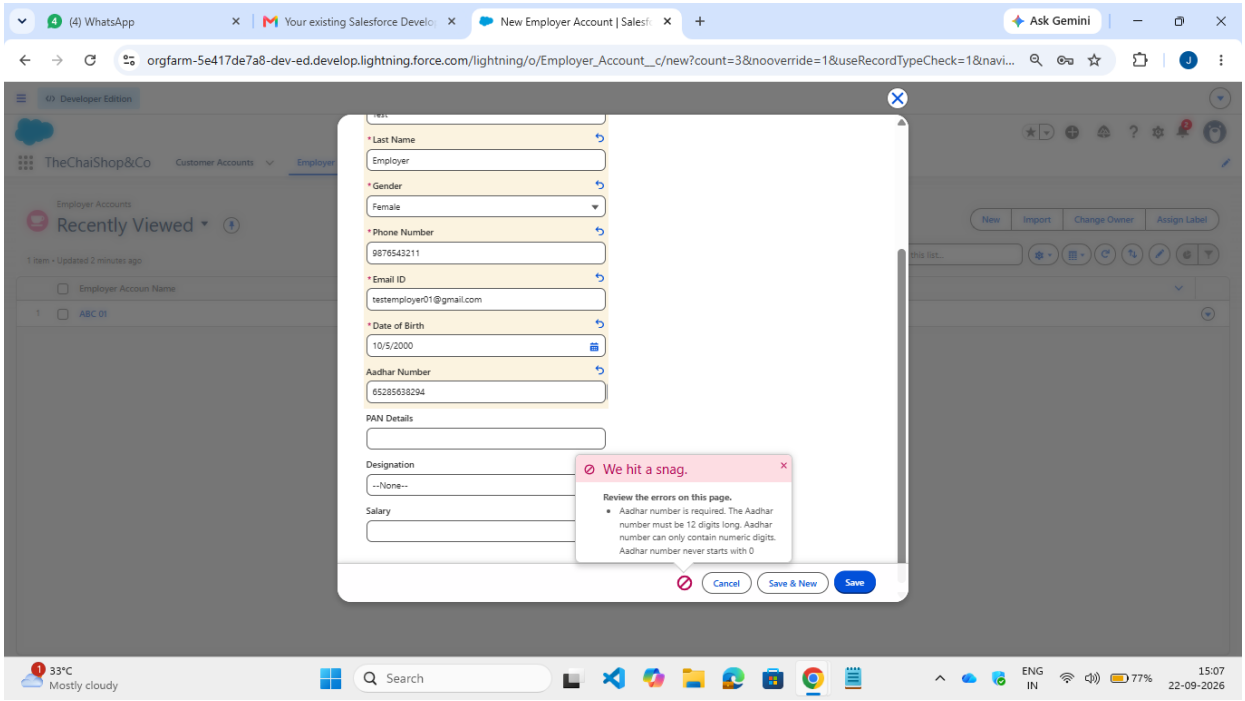

Figure 11. Validation testing — Salesforce displays an error for invalid input.

8. Birthday Email Template and Email Alert

The project includes a Birthday Offer Email template and a Happy Birthday email alert. The email alert is associated with the Customer Account object and is designed to send the birthday offer to the email address stored in the customer record. The email automation is later called from the scheduled flow.

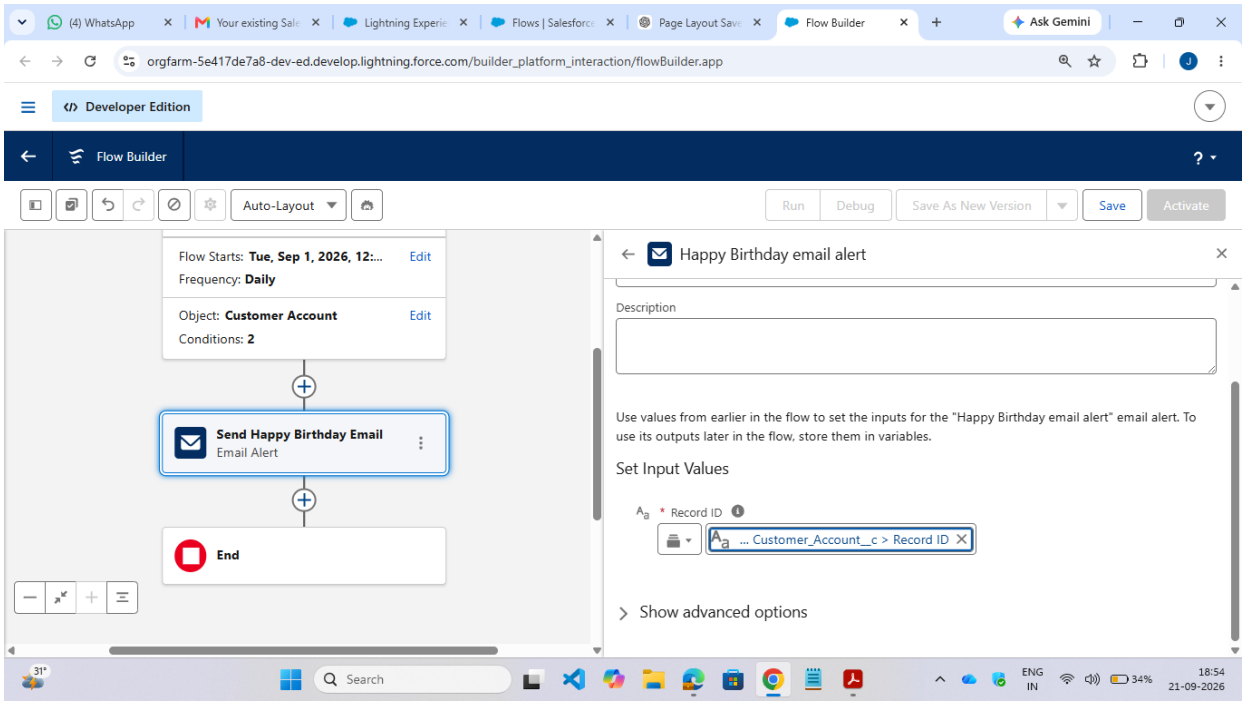

Figure 12. Email alert action used by the birthday automation.

9. Schedule-Triggered Birthday Flow

The birthday automation is implemented using a schedule-triggered flow. The flow runs daily against Customer Account records. Its purpose is to check the configured birthday condition and then invoke the Happy Birthday email alert for matching records.

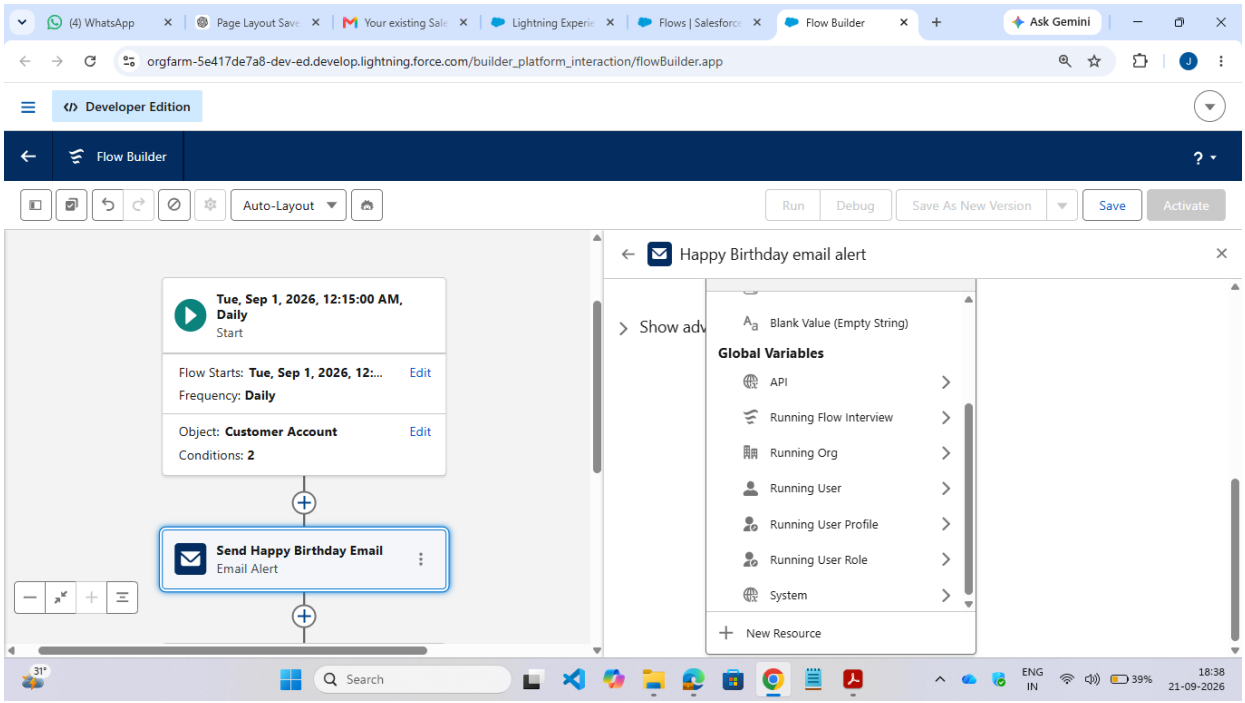

Figure 13. Scheduled flow start configuration for Customer Account.

The flow contains the Send Happy Birthday Email action. The Record ID is supplied from the Customer Account record so that the email alert has the correct record context. The final working configuration uses the Customer Account record identifier rather than an incompatible resource.

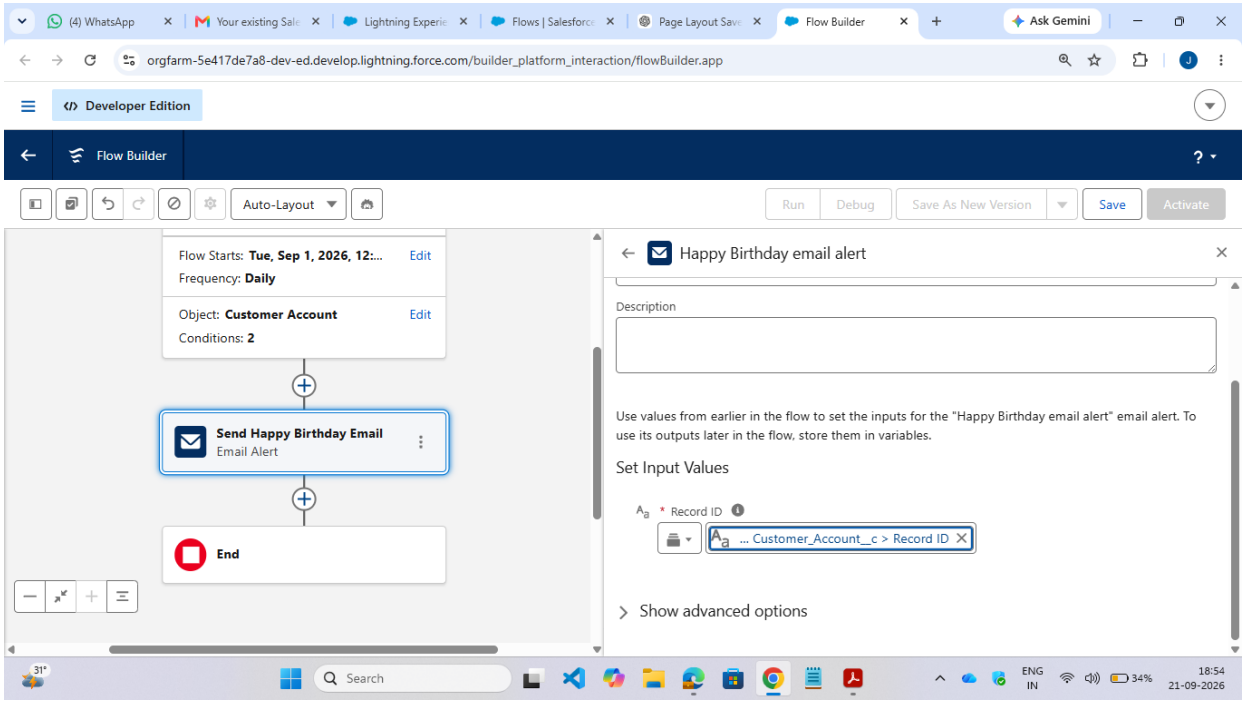

Figure 14. Send Happy Birthday Email action with Customer Account Record ID.

During flow configuration, Salesforce can show a data-type error if an incompatible resource is entered for the Email Alert Record ID. The project evidence also records this troubleshooting stage. This was corrected by using the appropriate Customer Account record identifier before saving the flow.

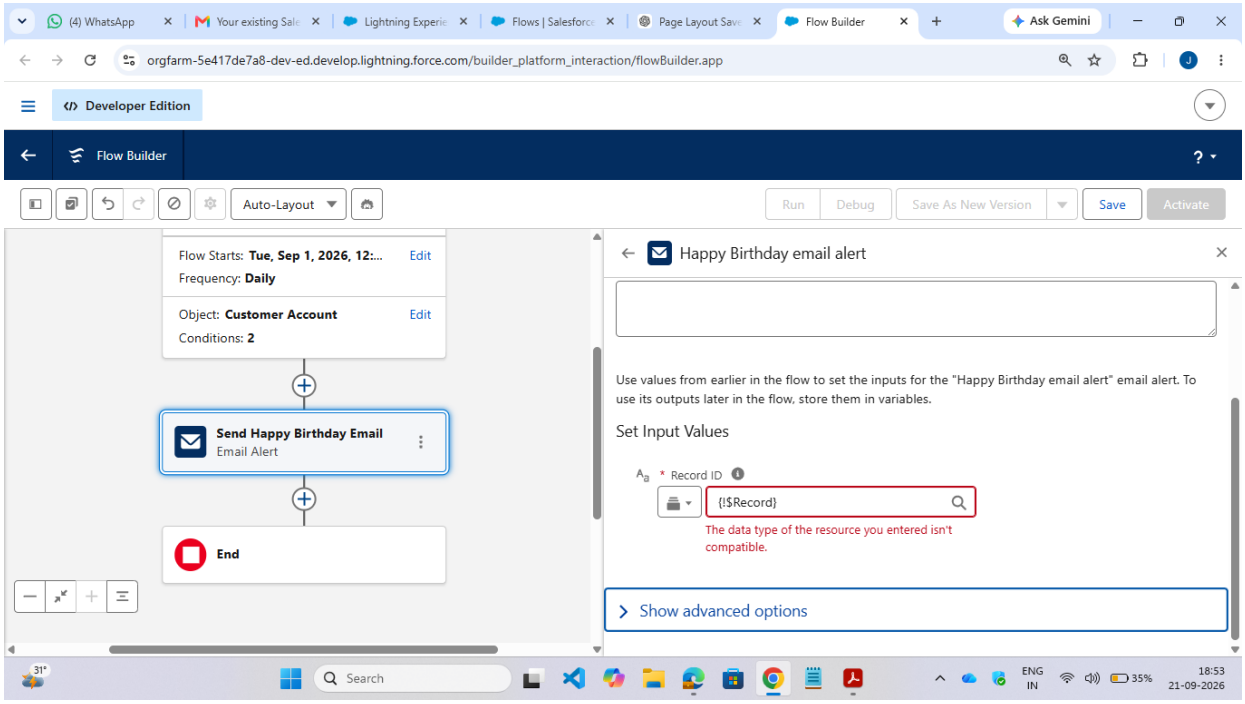

Figure 15. Flow troubleshooting evidence — incompatible Record ID resource.

The flow was then saved after the action and configuration were corrected. Saving the flow records the automation so that it can be activated and used by the Salesforce environment.

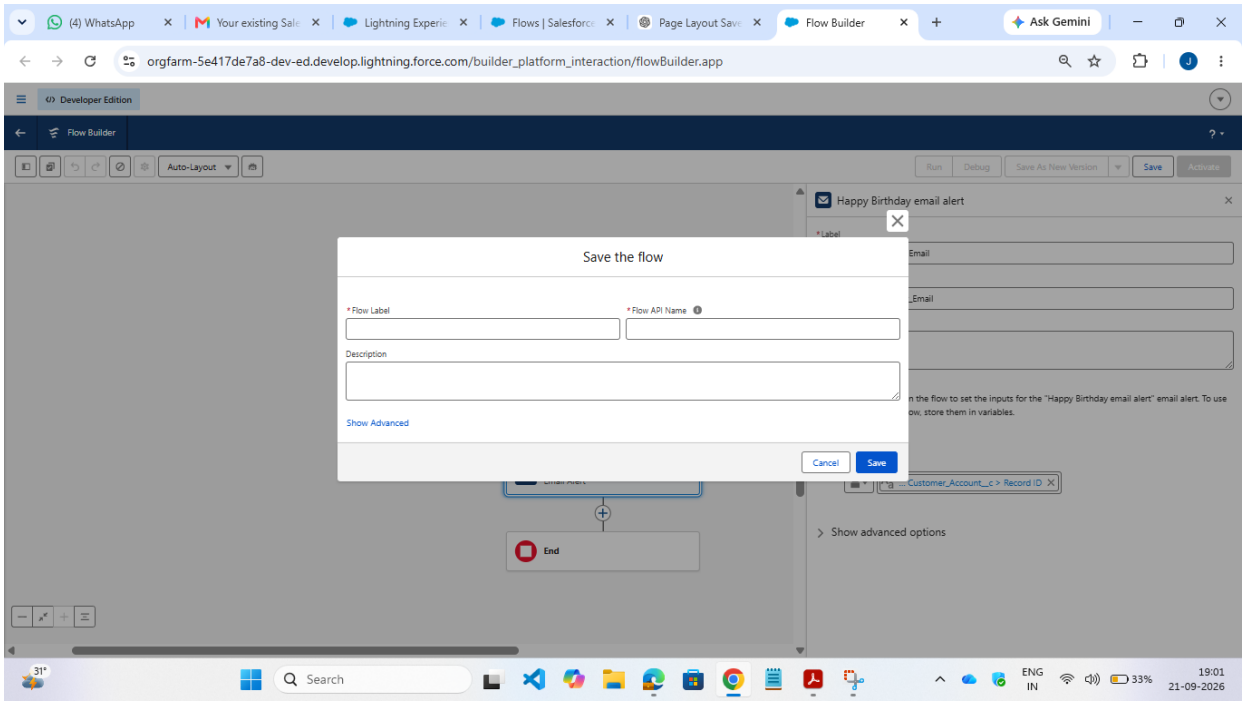

Figure 16. Flow save stage.

10. Test Records and Data Verification

Test records were created to verify that the configured objects and fields work with real Salesforce data. The Customer Account test records appear in the Customer Accounts list, and employer test records appear in the Employer Accounts list. These records are also used as the source data for report generation.

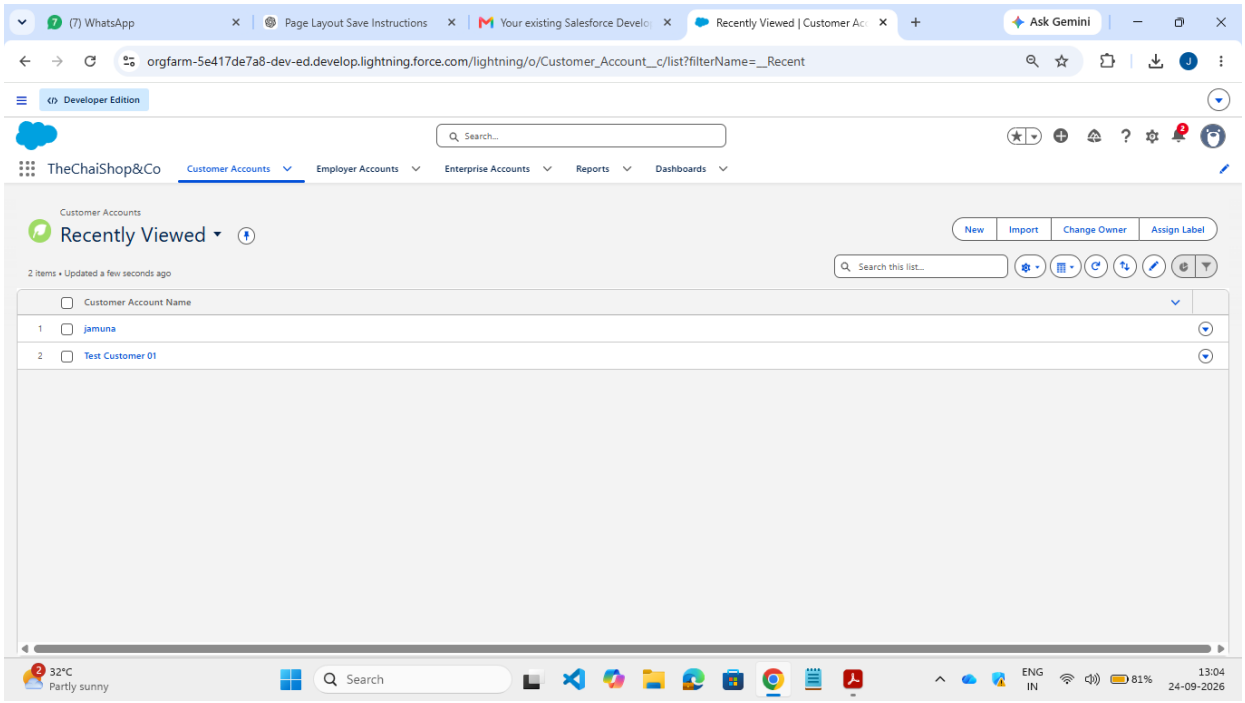

Figure 17. Customer Account data used for testing.

11. Customer Account Sales Report

The Customer Account Sales Report displays order information for customer records. The report includes Customer Account Record Type, Customer Account Name, Type of Items, Products Purchased, Chai, Payment Mode, Order Quantity and Total Bill. The completed report shows two Online Order records and a subtotal/total for the displayed order quantities and bills.

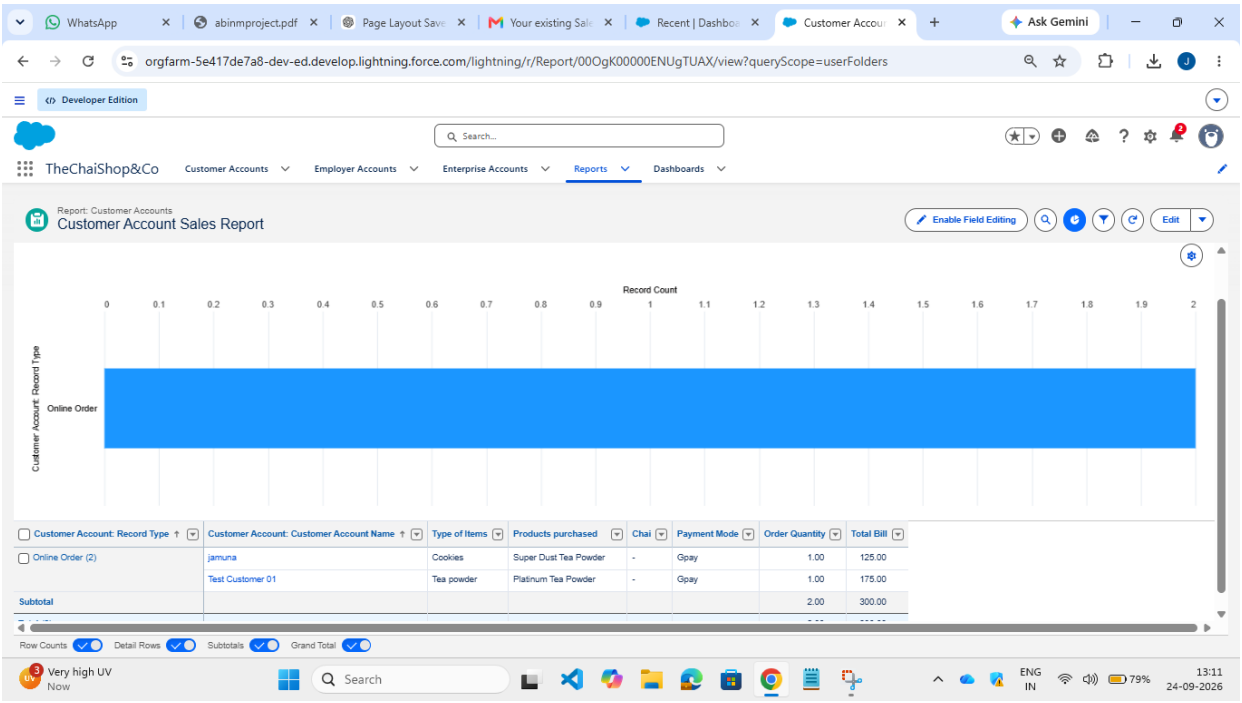

Figure 18. Customer Account Sales Report with populated test data.

12. Enterprise Account Sales Report

The Enterprise Account Sales Report presents enterprise order information in a similar analytical format. The evidence includes Type of Items, Enterprise Account Name, Enterprise Name, Products Purchased, Payment Mode, Order Quantity and Total Bill. The report therefore provides a separate view of enterprise sales data.

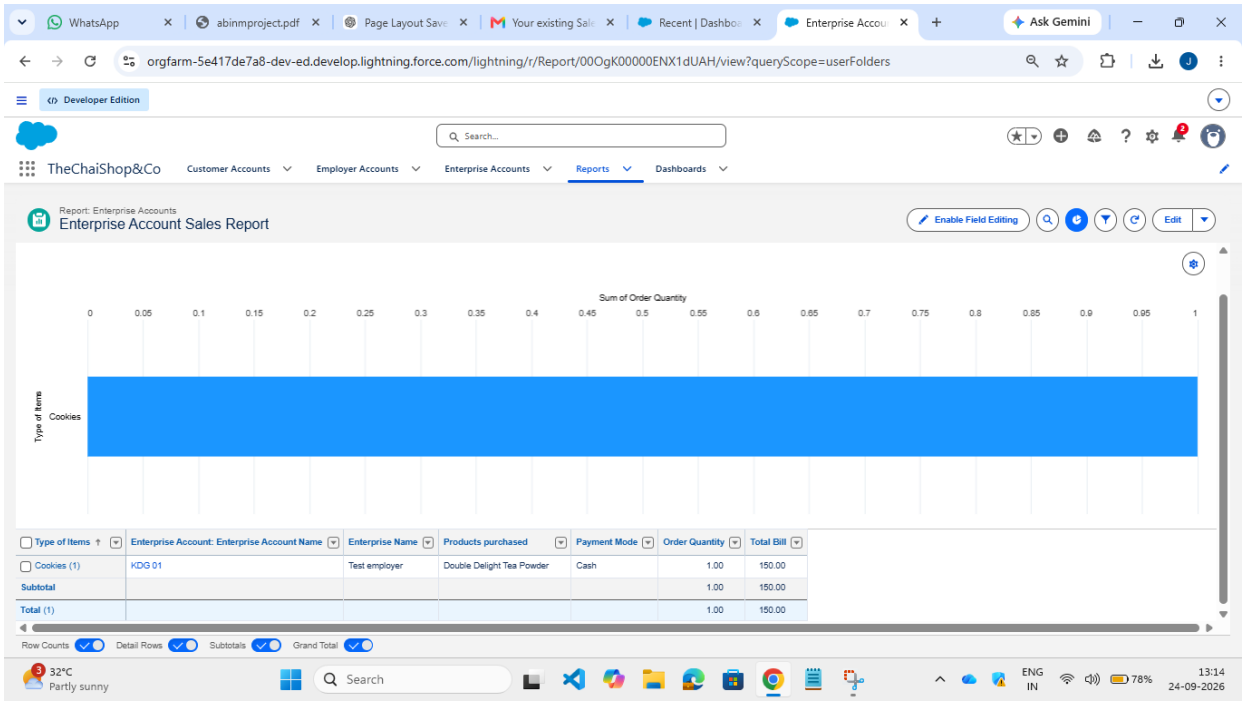

Figure 19. Enterprise Account Sales Report.

13. Customer Vs Enterprise Sales Dashboard

The Customer Vs Enterprise Sales dashboard combines the Customer Account Sales Report and Enterprise Account Sales Report as dashboard components. The Customer component is displayed as a horizontal chart and the Enterprise component as a chart based on order quantity. This gives a single page for viewing the configured sales analytics.

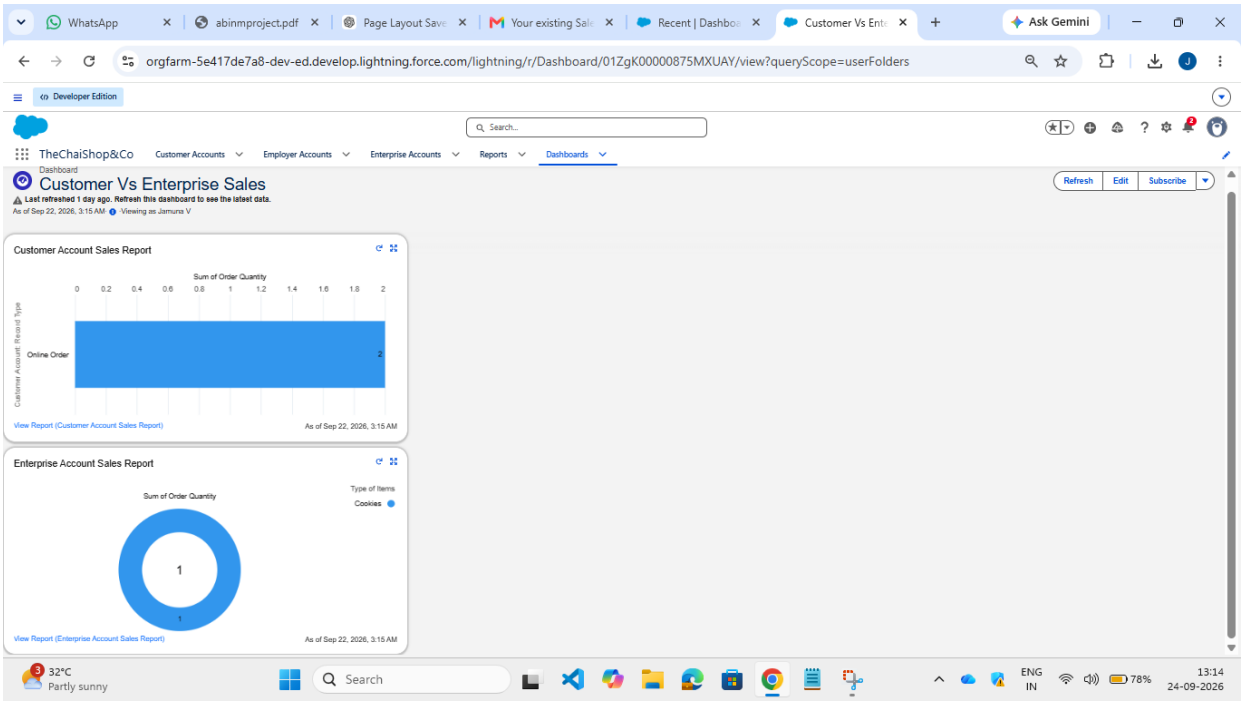

Figure 20. Customer Vs Enterprise Sales dashboard.

14. Testing Summary

Testing was carried out across data entry, validation, automation and analytics. Invalid field values were checked against validation rules, test customer/employer records were created, report data was verified, and the dashboard was checked after the report components were added. The report and dashboard evidence demonstrates that the configured data can be summarized using Salesforce analytics.

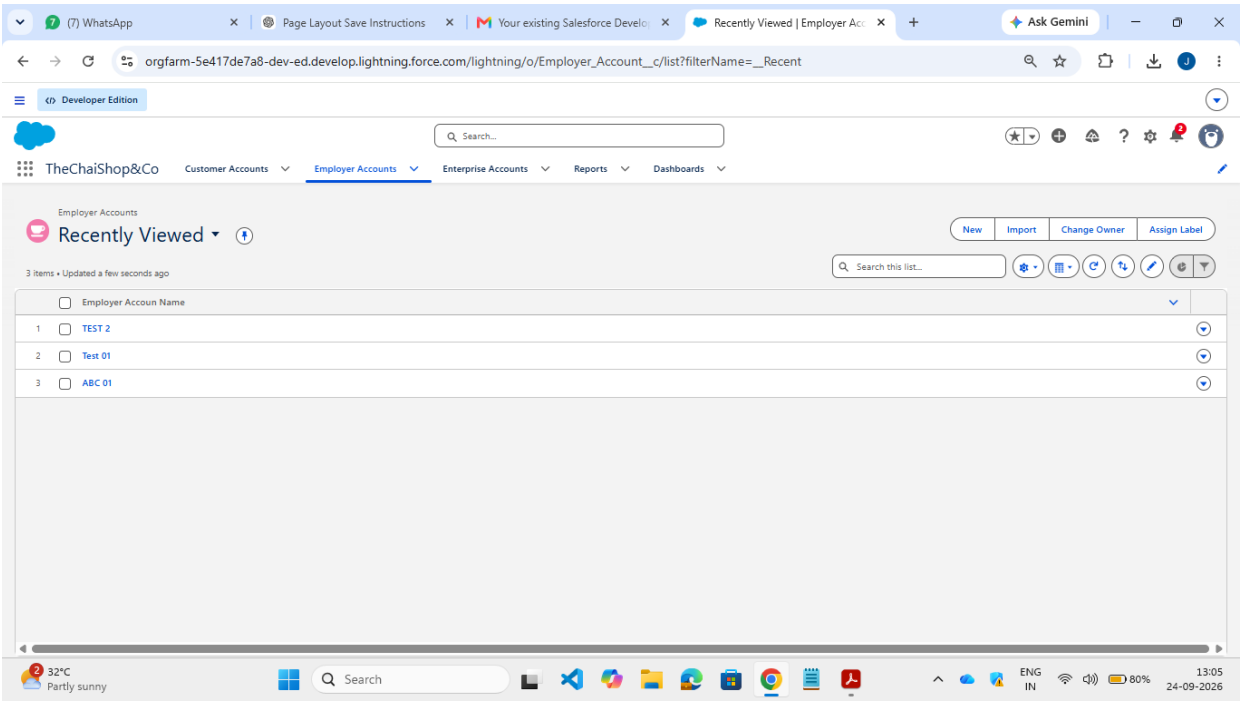

Figure 21. Test-data evidence from the project.

15. Conclusion and Future Enhancements

The completed Salesforce CRM implementation brings together structured account management, page layouts, record types, validation rules, email automation, reports and dashboards. The project demonstrates how Salesforce can reduce repetitive manual work while improving consistency of data entry and visibility of sales information. Possible future enhancements include additional automation, richer analytics, inventory integration, mobile-oriented workflows and additional customer communication channels.

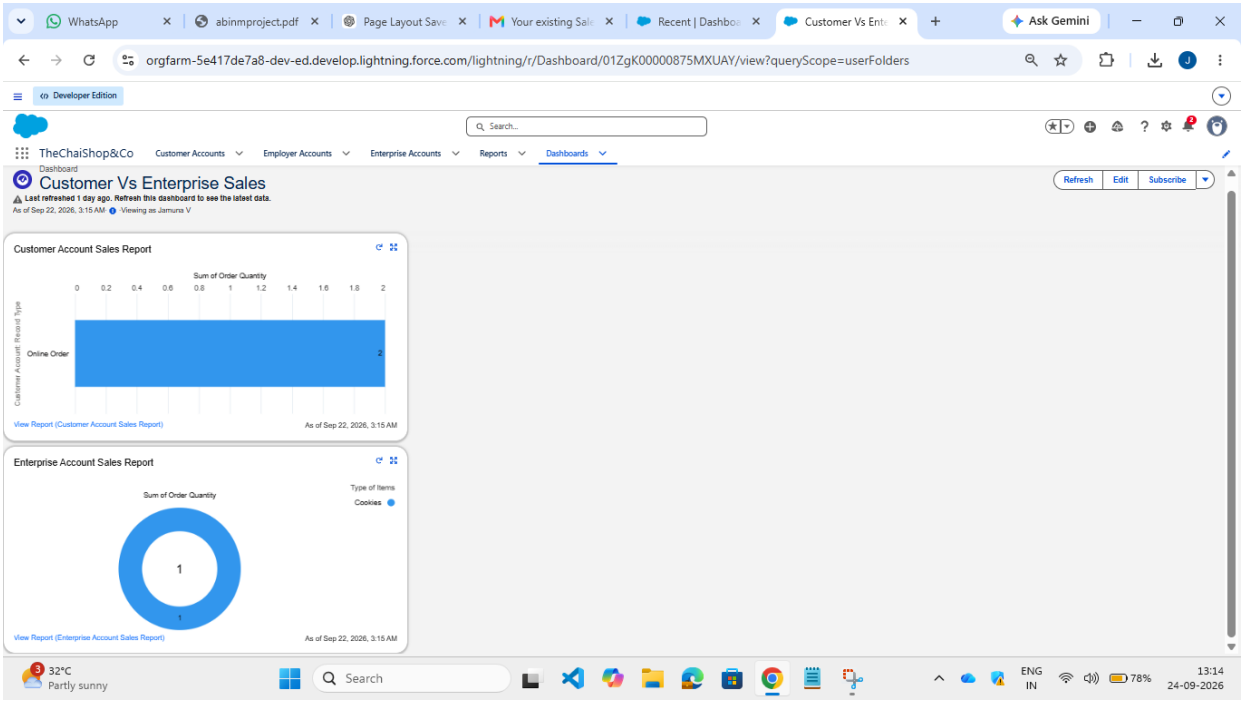

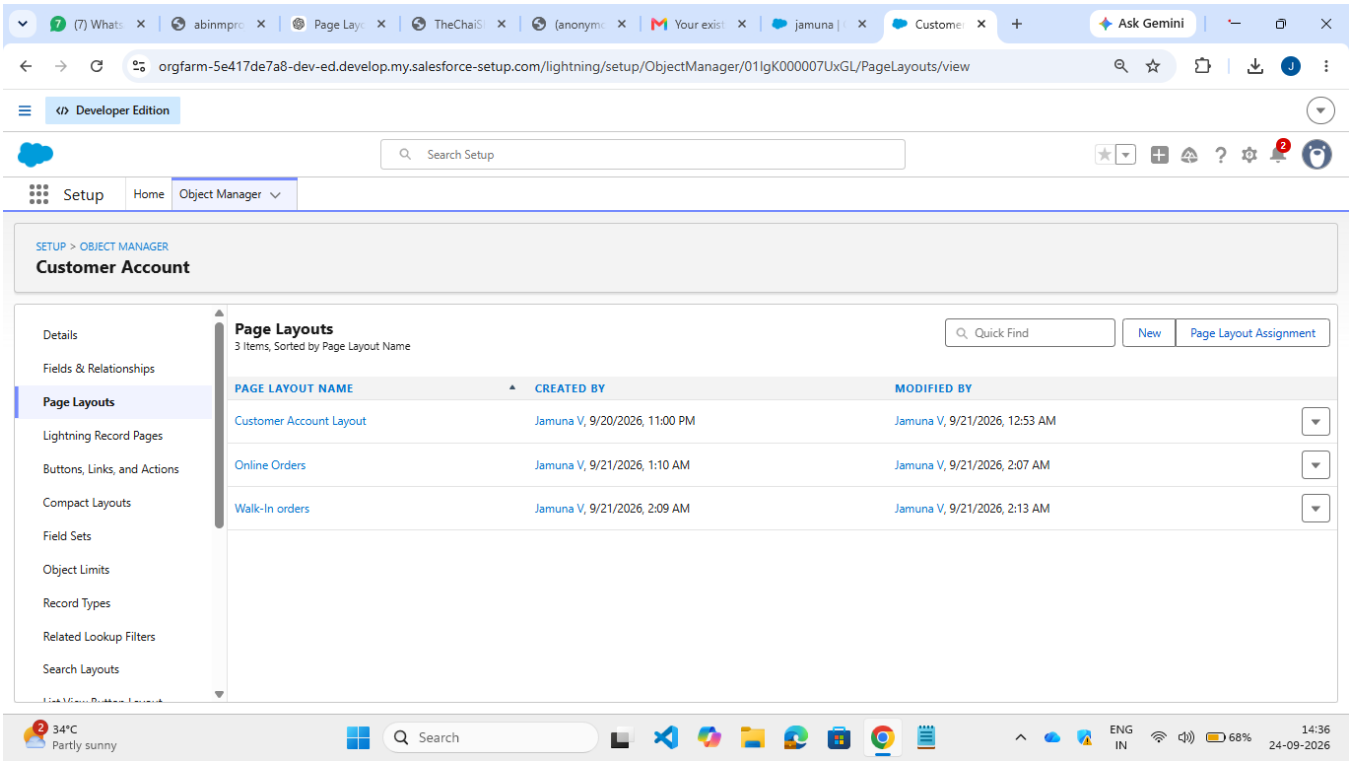

Figure 22. Final dashboard evidence supporting project completion.

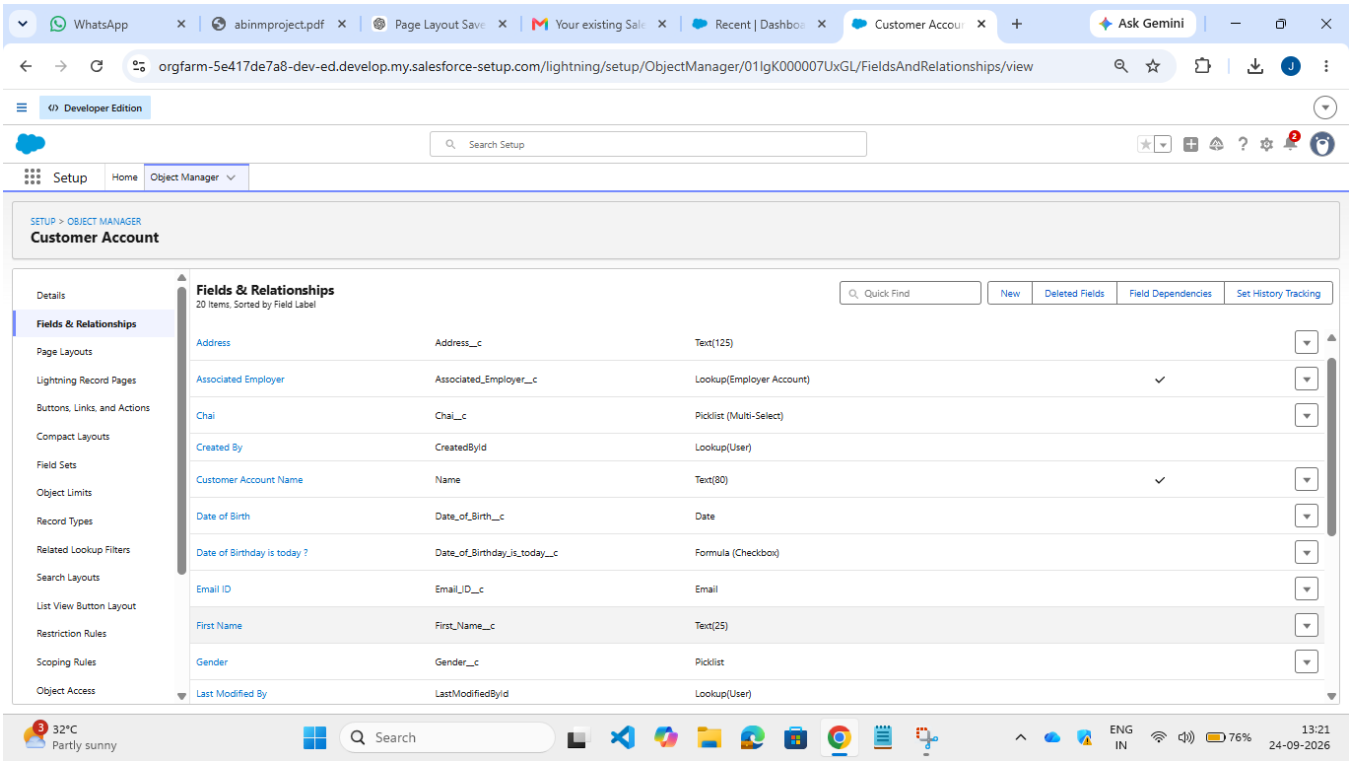

Page Layout Configuration

The Customer Account Page Layouts section shows the configured layouts for Customer Account. The available layouts include Customer Account Layout, Online Orders, and Walk-In orders. This screenshot provides direct evidence that the page-layout configuration was created and saved in the Salesforce project.

Evidence Page 25 — Screenshot captured from the project Salesforce environment.

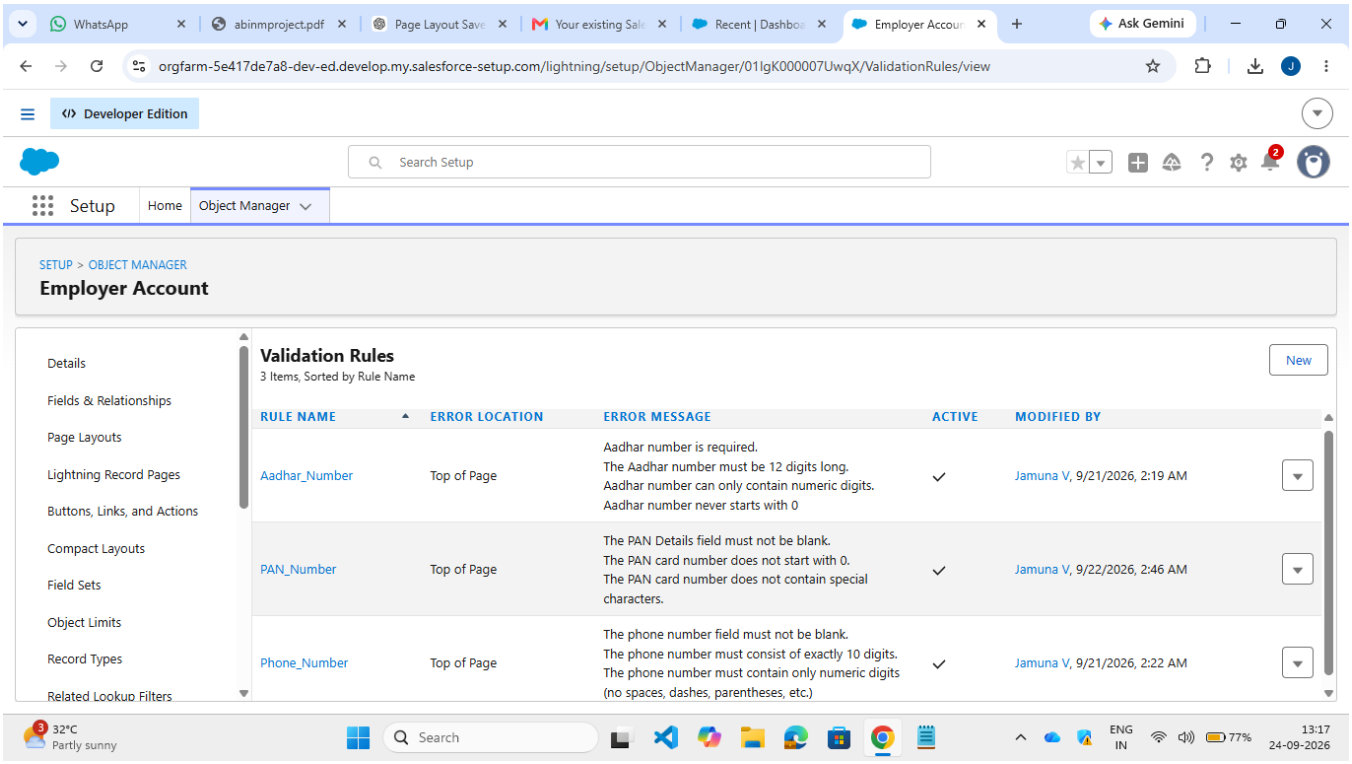

Customer Account Fields

The Fields & Relationships screen lists the custom fields configured for the Customer Account object, including Chai, Date of Birth, Email ID, First Name, Gender, and the birthday formula field. This confirms that the required data fields were created and configured in the object.

Evidence Page 26 — Screenshot captured from the project Salesforce environment.

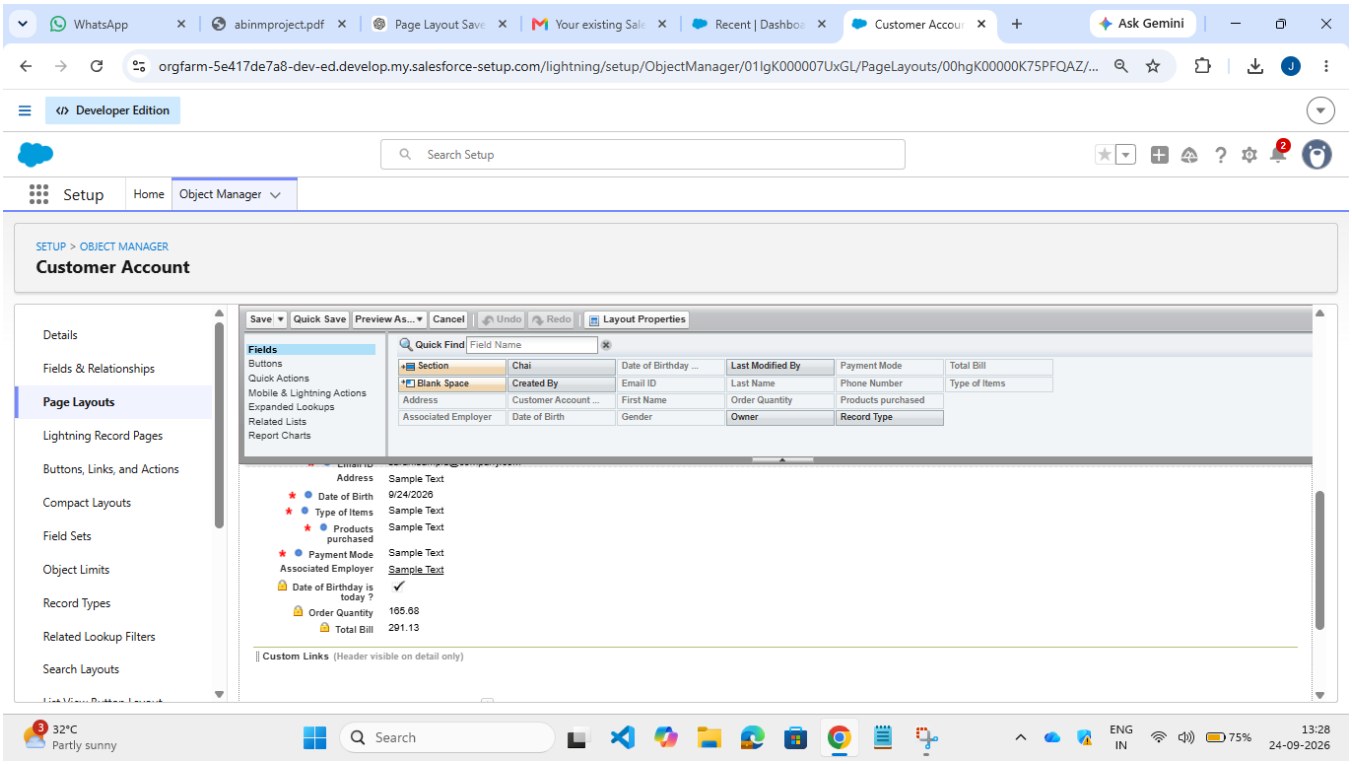

Validation Rules

The Employer Account Validation Rules page shows active validation rules for Aadhaar Number, PAN Number, and Phone Number. The displayed error messages specify the expected formats and restrictions, demonstrating that invalid data is prevented at the record level.

Evidence Page 27 — Screenshot captured from the project Salesforce environment.

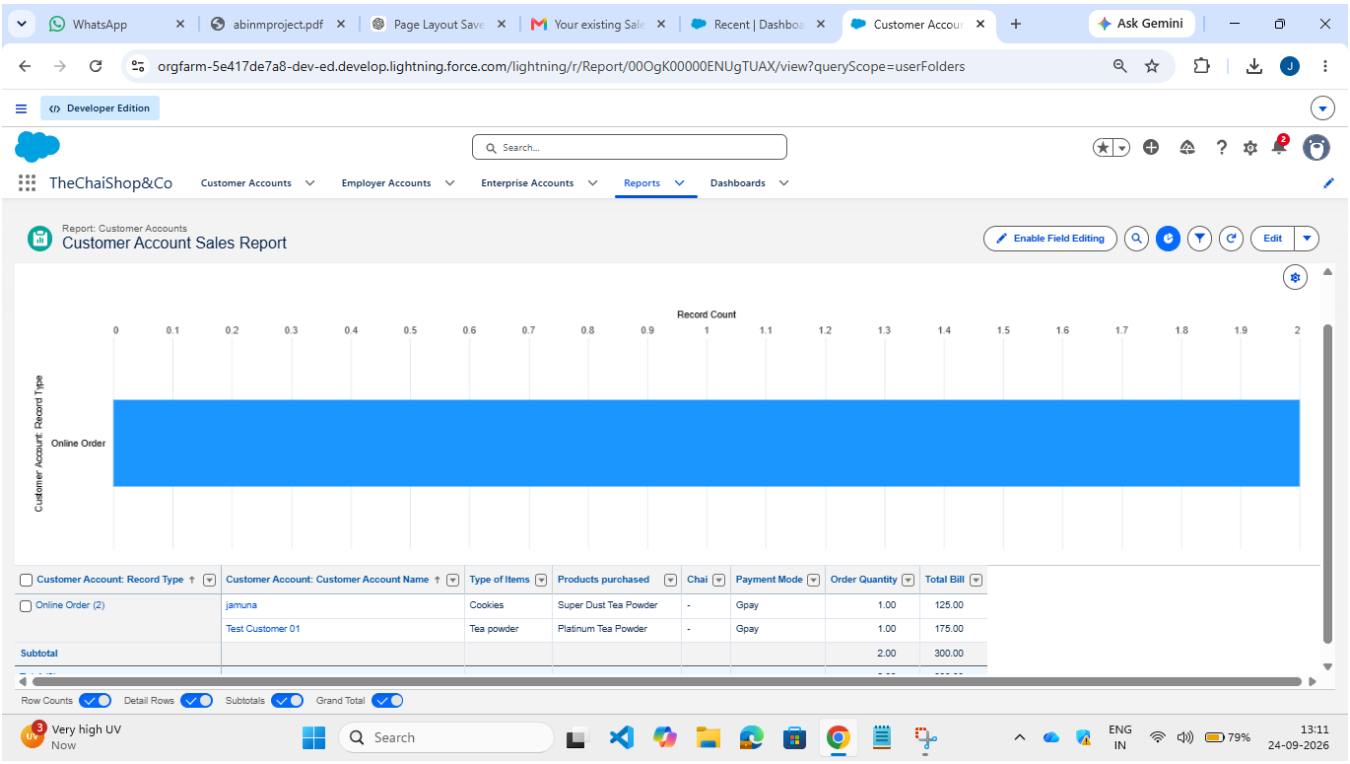

Page Layout Editor

The Customer Account Page Layout editor shows the fields arranged in the layout, including Chai, Date of Birth, Payment Mode, Type of Items, Order Quantity, and Total Bill. The screenshot demonstrates how the record-page fields were organized for practical data entry and viewing.

Evidence Page 28 — Screenshot captured from the project Salesforce environment.

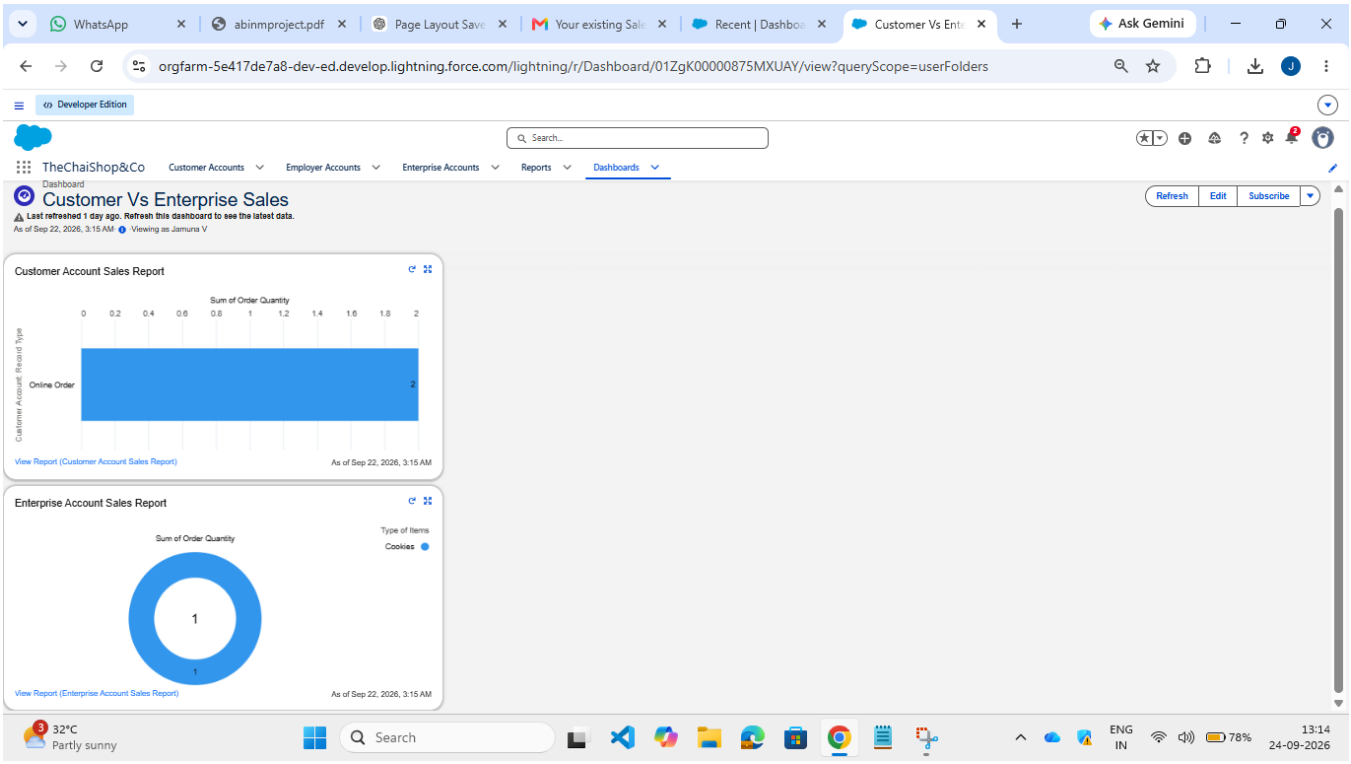

Customer Account Sales Report

The Customer Account Sales Report displays the configured report columns and a chart based on the Customer Account records. The report includes order quantity and total bill information along with customer and product details, providing evidence that reporting was configured successfully.

Evidence Page 29 — Screenshot captured from the project Salesforce environment.

Customer Vs Enterprise Sales Dashboard

The final dashboard contains separate components for Customer Account Sales Report and Enterprise Account Sales Report. The dashboard presents the report results visually using charts, providing a consolidated view of the sales information configured in the Salesforce project.
